C -!- FUNCTION: Cytokine that binds to TNFRSF11B/OPG and to TNFRSF11A/RANK. Osteoclast differentiation and activation factor.
C Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play an important role in enhanced bone-resorption in humoral hypercalcemia of malignancy.
-!- SUBUNIT: Homorrimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Name=3;
IsoId=035235-3; Sequence=VSP_006448;
TISSUE SPECIFICITY: Highly expressed in thymus and lymph nodes,
but not in nonlymphoid tissues and is abundantly expressed in T
cells but not in B cells. A high level expression is also seen in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                form

alveolar mammary structures during pregnancy, resulting in dof newborns. Trance-deficient mice show severe osteopetrosis no osteoclasts, marrow spaces, or tooth eruption, and exhibit profound growth retardation at several skeletal sites, inclust the limbs, skull, and vertebrae and have marked chondrodysplawith thick, irregular growth plates and a relative increase hypertrophic chondrocytes.

SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cleavage.

Biophys. Res. Commun. 269:532-536(2000).

-!- FUNCTION: Cytokine that binds to TNFRSF11B/OPG and to TNFRSF11A/RANK. Osteoclast differentiation and activation factor. Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play an important role in enhanced bone-resorption in humoral hypercalcemia of malignancy.

-!- SUBGUNIT: Homotrimer (By similarity).

-!- SUBCELLULAR LOCATION: Type II membrane protein (isoforms 1 and 3) Secreted (isoform 2). A soluble form of isoform 1 arises by proteolytic processing (By similarity).

IsoId=014788-3; Sequence=VSP_006446;
TISSUE SPECIFICITY: Highest in the peripheral lymph nodes, we spleen, peripheral blood Leukocytes, bone marrow, heart, placskeletal muscle, stomach and thyroid.
INDUCTION: Up-regulated by T cell receptor stimulation.
PTM: The soluble form of isoform 1 derives from the membrane by proteolytic processing. (By similarity). The cleavage may k catalyzed by ADAM17.
SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                               express mRNA

PTM: The soluble form derives From the membrane form by proteolytic processing (By similarity).
DISEASE: A deficiency in this protein is the cause of generallymphoproliferation disease phenotype (gld). Gld mice presentlymphadenopathy and autoantibody production. The phenotype is recessively inherited.
SIMILARITY: Belongs to the tumor necrosis factor family. MEDLINE=95196085; PubMed=7889405; DOI=10.1016/1074-7613(94)90106 Lynch D.H., Watson M.L., Alderson M.R., Baum P.R., Miller R.E., Tough T., Gibson M., Davis-Smith T., Smith C.A., Hunter K.; "The mouse Fas-ligand gene is mutated in gld mice and is part of family gene cluster."; MEDLINE=95388076; PubMed=7544870; DOI=10.1016/0161-5890(95)00016 gld mice." Okumur c. Natl. Acad. Sci. U.S.A. 94:3914-3919(1997).

FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor the transduces the apoptotic signal into cells. May be involved cytotoxic T cell mediated apoptosis and in T cell developme TNFRSF6/FAS-mediated apoptosis may have a role in the induct peripheral tolerance, in the antigen-stimulated suicide of T cells, or both. Binding to the decoy receptor TNFRSF6B/Dc modulates its effects (By similarity).

"Cloning, sequencing, and homology analysis of nonhuman primate

Fas/Fas-ligand and co-stimulatory molecules.";

Immunogenetics 53:315-328(2001).

-I-FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor that transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DCR3

modulates its effects (By similarity).

-I-SUBUNIT: Homotrimer (Probable).

-I-SUBCELLULAR LOCATION: Type II membrane protein and secreted (By

-!- FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor that transduces the apoptotic signal into cells. May be involved in transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DCR3 modulates its effects.
                                                                                                                                                                                                                                                                                                                                                                                    S.d.,

```
The present sequence represents a human Apoptosis inducing molecule-I (AIM-I). AIM-I is a member of the tumour necrosis factor (TNF) ligand superfamily. The products can be used in the diagnosis and treatment of disorders related to under-expression, over-expression or altered expression of AIM-I. AIM-I or agonists can be used for treating autoimmune disorders including systemic lupus erythematosus, immunoproliferative disease lymphadenopathy (IPL), angioimmunoproliferative lymphadenopathy (AIL), rheumatoid arthritis, chaptes, and multiple sclerosis, graft versus host disease, to inhibit neoplasia such as tumour cell growth, to treat restenosis, to regulate haematopoiesis in endothelial cell development, to stimulate peripheral collerance and cytotoxic T-cell mediated apoptosis. Antagonists can be used for treating cachexia, cerebral malaria, rheumatoid arthritis or osteoporosis, for preventing graft-host rejection, and as anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE

                                                                                                                                                                                               A novel cytokine (AAW19777), designated Apo-2 ligand, induces mammalian cell apoptosis. It is belived to be a member of the tumour necrosis factor cytokine family. Its amino acid sequence was deduced from a cDNA clone (AAT72796) isolated from a human placental cDNA library. Apo-2 ligand polypeptides, esp. those corresponding to amino acids 114-281, 41 281, 15-281 or 1-281 of Apo-2 ligand, can be produced by culturing cells transformed or transfected with a vector contg. Apo-2 ligand nucleic acid. They can be used to induce apoptosis in mammals and to treat pathological conditions such as cancer (esp. breast or colon cancer) or to raise antibodies useful in diagnostic assays

                                                                                                                                                                                                                                                                                                                                                                                                                                              Human tumour necrosis factor related apoptosis inducing ligand (TRAIL) (AAW19787) is a novel cytokine that induces apoptosis of certain target cells, including cancer cells and virally infected cells. Its amino acid sequence was deduced from cDNA clone HuAIC (AAT72848), deposited in vector pDC409 as ATCC 69849. Recombinant TRAIL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used in the treatment of cancer (e.g. leukaemia, lymphoma and melanoma) and viral infections, or to raise antibodies that may be useful for treating thrombotic

TR6; tumour necrosis factor related receptor; human; treatment; stroke; inflammation; arthritis; septicaemia; autoimmune disease; restenosis; transplant rejection; infection; ischaemia; brain injury; bone disease; acute respiratory disease syndrome; acquired autoimmune disease syndrome; AIDS; cancer; atherosclerosis; Alzheimers disease; TRAIL; TNF; TL2. tumour necrosis factor-related apoptosis-inducing ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the human tumour necrosis factor (TNF)-related receptor, TL2 (also known as tumour necrosis factor-related apoptosis-inducing ligand, TRAIL). This protein is used in a method resulting in the isolation of the novel human TNF related receptor, TR6. TR6 polypeptides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, (acquired autoimmune disease syndrome) AIDS, bone diseases, cancer (e.g. lympho-proliferative disorders), atherosclerosis and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE

The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful for producing the recombinant TRAIL polypeptides, which may be useful in studies of apoptosis, to purify leukaemia, lymphoma or melanoma cells (e.g. to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marrow), or to treat viral infections
cytokine TNF-related apoptosis ligand polypeptides g recombinant polypeptides for research and therapy ymphoma, melanoma and viral infections.

```
The present sequence represents human AGP-1. AGP-1 is a tumour-necrosis factor (TNF)-related protein, involved in inflammation, myelopoiesis and bone resorption. It has the same nucleic acid and amino acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAIL) described in Immunity, 3 (1995) 673. Antibodies (Ab) are used as immunoassay reagents for detecting AGP-1 expression. Nucleic acid complementary to AGP-1 is used to regulate AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid arthritis, systemic lupus erythematosus, psoriasis, scleroderma, infection-related inflammation) or bone resorption diseases (e.g. osteoporosis, osteomyelitis, hypercalcaemia, Paget's disease). AGP-1 can be used to treat homber of bone marrow cells, particularly neutrophils and lymphocytes, e.g. where caused by disease, injury or exposure to myelosupressive agents. Host cells, produce recombinant AGP-1
                                                                                                                                                        240
                                                                                                                                                                                  240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes the use a polypeptide corresponding to at least the primary sequence of part of the present sequence to produce diagnostic, prophylactic or therapeutic composition useful in cases of degenerative, autoimmune and inflammatory diseases. The polypeptides c be used in treatment of neurodegenerative disease, lupus erythematosus rhuematoid arthritis, and SEP. The polypeptides are apoptotic in centranervous system cells, antigenic and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease a therapeutic target, e.g. its apoptotic activity can be blocked with

The Apo-2L polypeptide can be produced by standard recombinant methodology. Apo-2L is useful for inducing apoptosis in mammalian cancer cells. This is useful for the treatment of cancer. Apo-2L can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis, e.g. autoimmune disorders like lupus and immunemediated glomerular nephritis and cancer. Apo-2L and its nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        apoptosis

assays for Apo-2 ligand, e.g. detecting its expression in specific cells tissues, or serum. The antibodies may also be employed as therapeutics. For instance, anti-Apo-2 ligand antibodies which block Apo-2 ligand activity, like Apo-2 ligand-induced apoptosis, may be employed to treat pathological conditions or diseases associated with increased apoptosis. They are also useful for the affinity purification of Apo-2 ligand from recombinant cell culture or natural sources. The Apo-2 ligand itself may be used to treat diseases e.g. cancer, by inducing apoptosis in cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                            The present invention describes an antibody that binds to a human protein (1) selected from: PRO181; PRO1269; PRO1410; PRO175; PRO1780; PRO4334; PRO1927; PRO155; PRO1293; PRO1303; PRO4344; PRO4354; PRO4397; PRO1927; PRO155; PRO1096; PRO2038; and PRO2262. (1) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (1) can also be detected to diagnose tumours. Agents which inhibit the activity of (1), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (1), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (1). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                       240
                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                The present sequence represents a human TRAIL (tumour necrosis factor (TNF) related apoptosis-inducing ligand) polypeptide. The specification describes a method for enhanced killing of tumour cells. The method comprises contacting a susceptible tumour cell with a synergistic mixture of a TRAIL receptor ligand and a diterpenoid triepoxide in a combined dosage to kill at least 50 % of the cells. This mixture is synergistic, and so is active at lower doses and against otherwise resistant cell lines. The method is used for killing tumour cells, especially solid tumours or carcinomas (especially mammary carcinoma or non-small cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

The viral infections include hepatitis, and acquired immunodeficiency syndrome (AIDS), and the immune disorders be autoimmune disorders or transplant rejection. Cardiovascular discuch as arteriosclerosis may also be treated. The AGP-1 containing proteins have increased biological activity compared to the solubly proteins used in prior art therapies

The present sequence is one of twenty eight novel PRO polypeptides. The PRO polypeptides and their agonists, including antibodies, peptides, and small molecule agonists, may be used to treat various tumours, e.g., cancers such as breast cancer, ovarian cancer, renal cancer, colorectal cancer, uterine cancer, prostate cancer, lung cancer, bladder cancer, central nervous system cancer, melanoma or leukaemia. They are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunological disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful

                                                                                                                                                                                                                                                                                     ligand
                                                                                                                                                                                                                                                                                                                         The present invention relates to a formulation comprising Apo-2 liand divalent metal ions. Apo-2 ligand and the formulation are usef treating cancers and viral infections. Addition of divalent metal for making Apo-2 ligand and formulations containing Apo-2 ligand in increased yield and stability of Apo-2 ligand trimers
                                                                                                                                cancer
                                                                                                                                                                                                                                                                              form,
                                                                                                                                                                                                                                                                                                                                                                                                      .

```
The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human immunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is human TRAIL protein
New tumor necrosis factor related apoptosis inducing ligand polypeptides for treating viral infections (e.g. bovine viral diarrhea or human immunodeficiency virus), or cancers (e.g. leukemia or lymphoma).

The invention relates to a human tumour necrosis factor (TNF) related receptor, TR6. TR6 can be expressed by standard recombinant methodology.

The TR6 polypeptides are useful for treating chronic and acute inflammation, rheumatoid arthritis, septicemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. chost disease, infection, stroke, ischaemia, acute respiratory disease. Syndrome, asthma, restenosis, brain injury, AIDS, bone diseases, cancer, atherosclerosis, and Alzheimer's disease. These may also be used to inhibit production of TNF-alpha and eicosanoids, as research reagents and materials for discovering treatments and diagnostics to animal and human diseases. The polypeptides may further be used as immunosens to produce antibodies immunospecific for the TR6 polypeptides. The polymucleotides may also be used as hybridization probes for cDNA and genomic DNA, for isolating full-length cDNAs and genomic clones encoding TR6 and of other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  suffering
genes having high sequence similarity to TR6 gene, and for chromosome identification. The present sequence represents a human TL2 polypeptide TL2 is also known as TRAIL (TNF-related apoptosis-inducing ligand) and a ligand for the TL2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to treating an individual at risk for or sufferir from infection with a pathogenic or opportunistic organism. The method involves administering a combination of two to five agents comprising:

c (a) dendritic cell mobilisation factor; (b) dendritic cell maturation agent; (c) dendritic cell activation agent; (d) T cell enhancing factor; or (e) activated, antigen-specific T cells. The methods are useful for treating an individual at risk for or suffering from infection with a pathogenic or opportunistic organism, e.g. viruses (e.g. HIV), bacteria (e.g. M. tuberculosis), yeast, fungi (e.g. C. albicans) or protozoa (e.g. T. cruzi, which causes Chaga's disease). The methods are especially useful for treating an individual suffering from immunosuppression by enhancing a lymphocyte-mediated immune response. In particular, the method is useful for treating inflammations, chickenpox, oral or genital entres, multifocal leukoencephalopathy, hepatitis, AIDS, T cell leukemia or T cell lymphoma. The activated antigen-presenting dendritic cells are useful as a vaccine adjuvant. The present sequence represents a human TRAIL polypeptide fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                              The present invention relates to a new method for treating a tumourbearing subject. The method involves administering a combination of 2 to 5 agents comprising dendritic cell mobilisation factor, dendritic cell maturation agent, tumour-killing agent, T cell enhancing factor or activated, antigen-specific T cells. The method is useful for treating tumours or cancers in a subject e.g. skin cancer, prostate cancer, liver cancer, tumours of the bone, brain or spinal cord, actinic keratosis, or cervical intraepithelial neoplasia. The present amino acid sequence represents the human TRAIL protein that was used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                         cells comprising contacting a tumour cell with a synergistic combination of a death domain receptor ligand and a diterpenoid triepoxide. This method has cytostatic activity and works by blocking TNF-alpha mediated induction of c-IAP2 and c-IAP1. The method of the invention may be used for treating tumours, particularly solid tumours, e.g. carcinoma, mammary adenocarcinoma and non-small cell lung carcinoma also neurological malignancies, haematological malignancies, e.g. non-Hodgkin's lymphoma, chronic lymphocytic leukaemia, malignant cutaneous T-cells, mycosis fungoides, non-MF cutaneous T-cell lymphoma, lymphomatoid papulosis, T-cell rich cutaneous lymphoid hyperplasia, bullous pemphigoid, discoid upus erythematosus, lichen planus. The combination may be administered with other agents. The potent synergy between the diterpenoids and the death domain ligands allows increased killing at equivalent or lower doses, and can sensitise otherwise resistant cells. This sequence represents the human TNF related apoptosis inducing ligand (TRAIL) protein sequence. TRAIL is a death domain receptor used in the used method of the invention in combination with diterpenoid triepoxides to

```

The present sequence is that of human Apo-2 ligand (Apo-2L or TRAIL). The invention relates to methods of inducing apoptosis in mammalian cells, and especially to the use of Apo-2L receptor agonists and CPT-11 (a chemotherapeutic agent of the topoisomerase I inhibitor class) to synergistically induce apoptosis in mammalian cells, in particular mammalian cancer cells, and especially colorectal cancer cells (claimed). The cells may be in cell culture or in a mammal, e.g. a mammal suffering from cancer or a condition in which induction of apoptosis in the cells is desirable. A claimed method of treating cancer in a mammal comprises administering CPT-11 and Apo-2L receptor agonist, where the CPT-11 is administered about 6-72 hours prior to administration of the Apo-2L receptor agonist. Preferred Apo-2L receptor agonists include Apo-2L ceptor antibodies. Exposure of the cancer cells to CPT-11 and Apo-2L receptor antibodies. Exposure of the cancer cells to CPT-11 and Apo-2L receptor antibodies to upregulation of DR4 and DR5 receptors, directing the cells towards an apoptotic pathway rather than cell cycle arrest and possible DNA repair, thus providing enhanced antitumour activity. An example illustrates the synergistic inhibition of tumour growth by Apo-2L and CPT-11 in athymic nucle mice injected s.c. with human contacts and contacts. ö cancer; tumour; on of tumour s.c. with human 120 9 9 ${\color{red} H}$ 18 MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 1 MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE of CPT-11 which is a chemotherapeutic agent of the topoisomerase bitor class, and Apo-2 ligand receptor agonist for enhancing tosis in mammalian cells, or for treating cancer in a mammal. (I) is useful for producing a polypeptide, by culturing (I) comprising nucleic acid encoding the polypeptide, which is heterologous to the strain, such that the nucleic acid is expressed, and recovering the heterologous polypeptide from the strain. The heterologous polypeptide is proteolytically sensitive. Culturing of (I) is performed in a fermentor under conditions of high- or low-cell density fermentation. The polypeptide is an antibody (humanised or full-length antibody) or Apo2 ligand. The antibody (humanised or full-length antibody) or Apo2 ligand. The antibody is an anti-vascular endothelial growth factor (VEGF), anti-tissue factor, 2C4, anti-Her-2, anti-CD20, anti-CD40, or anti-CD11 antibody is an antibody fragment thaving a light chain (kappa light chain). The antibody fragment thaving a light chain (kappa light chain). The antibody fragment is a Fab, Fab', Fab'2 or Fab'2-leucine zipper fusion, anti-tissue factor Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine tag, and anti-cD18 Fab'2-leucine zipper fusion with a 6-histidine factom the present fusion with a 6-histidine factom the present fusion with a 6-histidine factom fab'd fusion fusion fab'd fusion fusion fusion factor fab'd fusion fusion fab'd fusion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method of producing a population of activated, Cryptococcus neoformans antigen-presenting dendritic cells, comprising causing the obtained dendritic cells to present the antigen and maturing the dendritic cells. The activated, C. neoformans antigenexpressing dendritic cells are useful for treating, or as vaccines or vaccine adjuvants against, C. neoformans infection, or for generating antigen-specific T cells. The present sequence is a human protein shown in the exemplification of the invention

The invention discloses isolated, naturally occurring, polypeptide splice variants of human tummour necrosis factor (TNF)-related apoptosis inducing cliquad (TRAIL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

Apoptosis is induced by certain cytckines which include TNF and TRAIL (also referred to as Apo-2 ligand, Apo-21). TRAIL is a type II membrane protein which induces apoptosis and nuclear factor-B (NF-B) activation in many tissues and cells. Receptors for TRAIL include two death domain containing receptors. DR4 and DR5, as well as two decoy receptors, DR4 and DR5, as well as two decoy receptors, DR2 interferons, induces apoptosis in tummour cells, whereas normal cells are relatively resistant without showing significant toxic side effects. Thus, TRAIL has the potential to be a very useful antitumour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/timing and activity. Determining these factors could provide possible mechanisms for the naturally occurring splice variants may differ in the cellular distribution and ratios of expression of TRAIL, and its splice variants, in a biological sample and to identify compounds which bind the variant TRAIL products and modulate its activity (agonists and antagonists). Pharmaceutical compositions, comprising an expression vector or any of the amino acid sequences, are useful for causing a main antagonists). Pharmaceutical compositions, comprising the level of the amino acid sequences, are useful for causing a cytotoxic effect in cancer cells and for treatment of diseases which cannon ocid sequences. The antibodies may also have a therapeutic utility in blocking or decreasing the activity of the TRAIL variant products autoimmume diseases. The antibodies may also have a therapeutic utility in blocking or decreasing the activity of the TRAIL variant products autoimmume diseases, diseases involved in the non-normal devenue presented 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

ation Novel isolated Apo-3 polypeptide useful for inducing apoptosis mammalian cells, for generating antibodies, in affinity purific techniques, and in competitive-type receptor binding assays.

52pp; English 4, 4; Fig Example

The invention relates to an Apo-3 polypeptide having an extracellular domain (ECD) sequence and a death domain sequence. The Apo-3 polypeptide has been found to stimulate or induce apoptotic activity in mammalian cells. Human Apo-3 exhibits similarities to the tumourn necrosis factor receptor (TNFR) family of polypeptides. The invention also relates to a chimeric molecule comprising an extracellular domain sequence comprising receptor (TNFR) family of polypeptides. The invention also relates to a chimeric molecule comprising an extracellular domain sequence comprising residues 1-198 of Apo-3 tused to a heterologous amino acid sequence. The Apo-3 polypeptide is useful therapeutically to induce apoptosis in mammalian cells. Decreased levels of apoptosis has been associated with conditions such as cancer, lupus, and herpes virus infection. Increased levels of apoptosis are associated with diseases such as acquired immunodeficiency syndrome (AIDS), Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, multiple sclerosis, retinitis pigmentosa, cerebellar degeneration, aplastic anaemia, myocardial infarction, stroke, reperfusion injury, and toxin-induced liver disease. The Apo-3 polypeptide is also useful in non-therapeutic applications such as in quantitative diagnostic assays as a control against which samples containing unknown quantities of Apo-3 may be prepared, in generating antibodises, as standards in assays for Apo-3, in affinity punifications and in competitive-type receptor binding assays. The chimeric rechniques, and in competitive-type receptor binding assays. The chimeric App-3 antibodises. The present sequence represents polypeptide sequence represents polypeptide sequence of the human Apo-2 ligand protein which is also reported to be involved in apoptotic cell death. In the current invention the apoptotic activity of the human Apo-2 ligand protein was measured on human lymphoid cells erating fication the chimeric sequence of nvolved in oplications such which samples

vivo r inducing or for in or for stimulating on e.g. cancer cells, New isolated Apo-3 polypeptides, useful for apoptotic activity in mammalian cells, e.g. or ex vivo gene therapy techniques.

Example 4; Fig 4; 50pp; English.

The invention relates to an isolated Apo-3 polypeptide. The Apo-3 polypeptides are useful for stimulating or inducing apoptotic activity in mammalian cells e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques. The Apo-3 chimeric molecules are useful for inhibiting apoptosis, or as immunogens used in generating antibodies. The antibodies may be used to block excessive apoptosis, for instance in neurodegenerative disease, or to block potential autoimmune/inflammatory effects of Apo-3 resulting from NF-kappaB activation. The nucleic acid sequences are useful as diagnostics for tissue-specific typing, for preparing Apo-3 polypeptides, or for generating transgenic or knockout animals. The transgenic or knockout animals are useful in developing and screening of therapeutically useful reagents. The present sequence represents the amino acid sequence of human Apo-2 ligand

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide, PRO polypeptide lacking its associated signal peptide or PRO polypeptide extracellular domain with or without its associated signal peptide. The PRO polypeptide or an antibody binding to it is useful for inhibiting the growth of a tumor cell. A composition containing a PRO polypeptide is useful for inhibiting neoplastic cell growth or for treating a tumour, preferably cancer (such as liver, breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder, gastric, pancreatic, vulval, thytoid, central nervous system cancer, hepatic carcinomas, sarcomas, glioblastomas, melanoma or leukaemia) in a mammal. The PRO polypeptide is useful for identifying its agonists. The PRO polypeptide or an antibody binding to it. The PRO polypeptide or an antibody binding to it. The PRO polypeptide or an antibody binding to it. The PRO polypeptide or an antibody binding to it is also useful for treating neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelic, inflammatory, angiogenic and immunologic disorders. The present sequence represents the amino acid sequence of a PRO polypeptide or the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                             (TNF)
                                                                                                                                                                                                                         The invention discloses a method for examining allergic diseases, which comprises measuring the expression level of tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) gene in a specimen from the patient and comparing this level with the level in healthy persons. TRAI gene expression is decreased in patients. The nucleic acids and polypeptide can be used to screen for agents for the treatment of allergic diseases, possibly using a transgenic rodent as a model animal for the disease, with effectiveness determined by changes in expression levels or protein activity. The method is useful for the diagnosis, examination, prevention and treatment of allergic diseases, including atopic skin inflammation. The sequence presented is the human TRAIL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; TNF-related apoptosis-inducing ligand; Kaposi's sarcoma; cancer; hyperproliferative disorder; rheumatoid arthritis; Parkinson's disease; neurodegenerative disorder; Alzheimer's disease; Hashimoto's disease; allergic disorder; acquired immune deficiency syndrome; ocular disorder, myasthenia gravis; autoimmune disorder; Huntington's disease; vaccine; septic shock; multiple sclerosis; inflammatory disorder; liver injury;

The invention relates to antibodies that immunospecifically bind to tumour necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) receptors (TRAIL-R). Antibodies of the invention are useful for treating, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, breast, colon, lung and gastrointestine and Kaposi's sarcoma) and other cast, colon, lung and gastrointestine and Kaposi's sarcoma) and other carrier disease, Alzheimer's disease and Huntington's disease), autoimmune disorders (e.g. lupus, rheumatoid arthritis, multiple sclerosis, myasthenia gravis, Hashimoto's disease and immunodeficiency syndrome; AlDS, herpes viral infections and other viral rheumatoid arthritis), infectious diseases (e.g. acquired immune disorders disease, spendrome; AlDS, herpes viral infections and other viral infections), myelodysplastic syndromes (e.g. aplastic anaemia), graft-cufections, myelodysplastic syndromes (e.g. aplastic anaemia), graft-cufections), myelodysplastic syndromes (e.g. aplastic anaemia), graft-cufections, cerebrovascular disorders, thrombotic microangiopathies, disorders, cerebrovascular disorders, thrombotic microangiopathies, and ulcerative colitis and for wound healing. The invention is also used the prepare vaccines. The present sequence is human TRAIL protein also

                                                                                                                                                                                                                                                                                                                                                                                                     claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antibody that specifically binds: (a) the human tumor necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) protein appearing as ABU08558; (b) a soluble human TRAIL polypeptide; (c) a polypeptide comprising amino acids 124-276 of ABU08558, or (d) a fragment of the TRAIL protein. Also included is an antigen-binding fragment of the antibody (a monoclonal antibody), a hybridoma cell line that produces the antibody. The antibody is used in assays to detect the presence of TRAIL polypeptides, either in vitro or in vivo, purifying TRAIL by affinity chromatography, blocking binding of TRAIL to target cells and thus inhibiting a biological activity of TRAIL.
                                                                                                                                                                                                                                                                                                                                                                              20"

          the detection, prevention and treatment of disease. In one embodiment, the detection, prevention and treatment of disease. In one embodiment, the heterotrimeric complex comprises full-length or extracellular portions of other TNF ligand family members, preferably RANKL. The heterotrimeric complexes of the invention are useful for treating an autoimmune disease, cancer or osteoporosis, and particularly for inhibiting cancer cell proliferation, increasing B cell proliferation, or inducing apoptosis of T cells. A claimed method of inducing apoptosis of T cells. A heterotrimeric complex consisting of FasL and LIGHT, TNF-alpha, lymphotoxin-beta or TRAIL. A claimed method of inhibiting cancer cell proliferation involves administering a heterotrimeric complex consisting of TRAIL and CD40L or RANK. A claimed method of treating osteoporosis comprises administering an antibody against a complex comprising RANKL and TRAIL
                                                                                                                                                                                                                                                                                                                                                  9

The invention relates to an isolated antibody comprising a first amino acid sequence having 95 % identity to a second amino acid sequence of either variable heavy chain or light chain-complementarity determining regions (VHCDR1)/HCDR1, VHCDR2/VLCDR2 or VHCDR3/VLCDR3 appearing as ABG71906-ABG71911 being specific for human TRAIL receptors 1-4 (TNF (tumour necrosis factor)-related apoptosis-inducing ligand receptor, also known as TR4, TR5, TR7 and TR10). Also included are an isolated cell that propertied or detecting, diagnosing, prognosing or arthogological propertied or detecting, diagnosing, prognosing or monitoring cancers, and other hyperpooliferative disorders) using the antibodies, a hybridoma cell line selected from the hybridoma cell lines contained in ATCC Deposit No. PTA-1319, PTA-2687, PTA-1369, PTA-2730, PTA-2369,

syndrome.

The invention relates to a novel antibody or its fragment, which immunospecifically binds tumour necrosis factor Delta (TNF-delta/APRIL).

The antibody of the invention has dermatological, immunosuppressive, antishlammatory, antirhemmic, antibarthritic, cytostatic, antianaemic, antiallergic, antirhemmic, antiparthritic, cytostatic, antianaemic, tuberculostatic, antidabetic, natiparthritic, cytostatic, antianaemic, antiallergic, antidabetic, antiparthritic, ophthalmological, tuberculostatic, antidabetic, antibactic, antiparthritic, antiparthritic, antianaemic, antianteriosclerotic, vasotropic, thyromimetic, and haemostatic activity.

The antibody or its fragment are useful for treating, preventing or ameliorating cancer such as Non-Hodgkin's lymphoma or multiple myeloma in human, disease or disorder such as autoimmune disease, and graft versus cythematosus, rheumatoid arthritis or Sjogren's syndrome. The autibody is useful for detecting, disgnosing, prognosing, treating, preventing or ameliorating a disease or disorder associated with aberrant APRIL or APRIL receptor expression or aberrant function of APRIL or APRIL receptor expression or aberrant function of APRIL or APRIL receptor allergic encephalomyelitis, myocarditis, multiple sclerosis, dermatitis, asthma, allergic encephalomyelitis, myocarditis, multiple sclerosis, uveitis, tuberculosis, diabetes mellitus, psoriasis, cancer of the immune system, particularly B cell cancers, immune disorders such as mysathenia stravis diseases (e.g. acquired immunodeficiency syndrome (AIDS)), and proliferative disorders (e.g. leukemia). The present sequence represents

The present invention relates to novel antibodies that immunospecifically bind to TRAIL receptor (TR4). Sequences of the invention are useful for treating, preventing or ameliorating cancer (e.g. colon, breast, uterine, pancreatic, lung, gastrointestinal or cantral nervous system cancer e.g. medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in human. They are useful for detecting expression of TR4 polypeptide and cheeting, preventing or ameliorating cancers and other hyperprolating to ameliorating neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration and Huntington's disease, retinitis pigmentosa, cerebellar degeneration and Huntington's disease, polymyositis, immune-related glomenloophicitis, multiple sclerosis, sjoyren's syndrome, biliary cirrhosis, Behcet's disease, Crohn's disease, polymyositis, immune-related glomenloophicitis, multiple sclerosis, polymyositis, immune-related glomenloophicitis, multiple sclerosis, infectious diseases (e.g. asthma, allergic disorders and rheumatoid arthritis), infectious diseases (e.g. acquired jimounocofficiency syndrome (AIDS), herpes viral infections and other viral infections) and proliferative mycocadial infections and other viral infections and other viral infections and toxin-induced liver diseases (such as that caused by stroken mycocadial infection and reperfusion injury), septic shock, cachaxia, morexia and toxin-induced liver diseases (such as alcohol). They are also useful for treating cardiovascular disorders including peripheral arther and cardiovascular tuberculosis, diseases or disorders associated with neovascularisation and reperfusion injury), septic and cardiovascular tuberculosis, diseases or disorders associated with neovascularisation and coular diseases (such as alcohol). Twey are also useful in the preparation or recovery from surgery, trauma, radion therapy and transmiting mylogenesis and as adjuvants to enhance immune responstiveness
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The invention relates to an isolated antibody or its fragments such as VHCDR1 (heavy chain variable domain complementarity determining region), VHCDR2, VHCDR3, VLCDR1 (light chain variable domain complementarity determining region), VLCDR2 or VLCDR3. The antibody or its fragment immunospecifically binds TRAIL (tumour necrosis factor; TNF-related apoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRAIL receptor 2 (TRAIL-R2), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or gastrointestinal cancer or Kaposi's sarcoma or cancer of the central nervous system such as medulloblastoma, neuroblastoma or glioblastoma or graft versus host disease, AIDS (acquired immune deficiency syndrome) or a neurodegenerative disorder. The invention is useful in antibody therapy. The present sequence is human TRAIL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The combination and cDNAs are useful for diagnosing, staging, treating or monitoring treatment of cancer, e.g. colon cancer and for detecting changes in expression of genes encoding proteins that are associated with DNA methylation. The protein is useful for screening molecules or compounds to identify at least one ligand that binds to the protein and for producing an antibody. The present sequence represents the amino acid sequence of a protein expressed in a disorder or process associated with

```
The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the Easidue position(s) selected from 20 positions such as S96C, S101C, S11C, V114C, R115C, E116C, N134C, N140C, E144C, N152C, S153C, R170C, S111C, V114C, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the residue position is, outside of the receptor contact region of the DR5.Apo2L complex, and displays high solvent accessibility in the crystal structure of the DR5.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, and further composition or an Apo-2 ligand variant polypeptide, and neuroprotective. The Apo-2 ligand variant polypeptide, inducing apoptosis in mammalian cells by exposing mammalian cells expressing a receptor selected from DR4 receptor and DR5 receptor to a therapeutically effective amount of the Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide,

                                  2
the Apo-2 ligand composition or the Apo-2 ligand trimer is useful for treating cancer (such as lung, breast, colon or colorectal cancer) or a immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the native human Apo-2 ligand protein the invention.

cancer; human.
                                          tumour necrosis factor family ligand. A composition comprising isolated antibody or its fragment is used for treating an indineed of decreased level of endokine alpha activity. The endokin polypeptide present in a heterotrimeric complex is used for traindividual having a disorder associated with excessive bone reserge osteoporosis, Paget's disease or arterial calcification. Individual having a disorder associated with insufficient bone comprises administering an endokine alpha antagonist, which is antibody that binds specifically to endokine alpha polypeptide present sequence represents the amino acid sequence of a tumoun

The present invention describes a predictor set comprising a plurality of polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase activity of cells, comprising obtaining a sample of cells, determining whether the cells express a plurality of markers, and cerrelating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polynucleotides and (3) identifying polynucleotides and (2) identifying polynucleotides and (3) identifying polynucleotides and polypeptides, analysing the plurality of a microarray of polynucleotides or polypeptides, and selecting polynucleotides or polypeptides that predict the sensitivity or esistance of cells associated with a disease state by using the expression pattern of the microarray. The polynucleotides and polypeptides are useful in predicting the centivity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining drug sensitivity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining sensitivity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining genetic profiles which aid in treating diseases and disorders (cancer) based on patient response at a molecular level. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for diagnosing or treating a hypoxia-regulated condition, such as tumourigenesis, angiogenesis, apoptosis, inflammation, erythropoiesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transportation, catecholamine synthesis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The method involves administering a composition comprising tumour necrosis factor (TNF)-gamma-beta and its receptors DR3 and TR6 to a person with, or suspected of having the disease or disorder. The antagonist of TNF-gamma-beta is useful for treating or ameliorating a gastrointestinal tract disease or disorder, specifically an inflammatory bowel disease, e.g. Crohn's disease or ulcerative colitis. The present sequence is huntarally protein. This sequence is used to illustrate the method of the

```
The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type of the invention is useful for a high-throughput method immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and cannot the composition is useful for detecting and to monitor the formulate prognosis and to design a treatment regimen and to monitor the

                                                                                                                                                                      The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence polypeptide, comprising 282 amino acids and having a sequence comprising 282 amino acids and having cone or more following amino acid substitutions at the residue positions or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant collypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence.

C current sequence that is referred to in claim 17 may contain cone or more of the potential substitutions highlighted in the features that is record.
                                                                                                                                                                                                                                                                                                                                                                                   ö

Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence. Note: The variant sequence that is referred to in claim 1 may contain one or more of the potential substitutions highlighted in the features table
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or
